

Project Overview

GETTING STARTED

Expected time per task, the two task types you will meet, and everything that is true no matter which one you get.

Time Per Task

AVERAGE HANDLING TIME

20 min ATTEMPT 20 min REVIEW Each task is expected to take around 20 minutes to attempt and around 20 minutes to review , whichever of the two task types you get. That budget covers reading the task, opening both websites in their own tabs, inspecting them fully, and completing all six fields.

What Counts as a Delivered Task

A TASK IS ONLY COMPLETE WHEN IT IS COMPLETE ON BOTH PLATFORMS

Delivering a task means more than filling in the six fields. The claiming and submission workflow has to be followed end to end on both platforms : the task claimed correctly, the Attempt URL recorded once the task shows as in progress, and the work submitted where it belongs. A task that is missing any of those steps is not considered delivered , no matter how good the evaluation itself is.

INCOMPLETE OR OUT-OF-PROCESS WORK DOES NOT MEET THE STANDARD

Work that is incomplete, submitted outside the workflow, or impossible to trace back to a properly claimed task does not meet the project's delivery standard and is not counted as valid output for the project. Take the extra minute to confirm every step was completed before you move on to the next task, because a task that falls outside the process cannot be recovered afterwards.

A Few Extra Clarifications

DO NOT REOPEN A TASK ONCE IT IS SUBMITTED

Once a task is submitted, do not go back and modify it, especially if a reviewer has already picked it up. Using Make Edits on a task that is already Signed Off can get your permissions removed from the project. Read your feedback, learn from it, and leave the task alone.

HOW SLACK WORKS ON THIS PROJECT

Reading the announcements channel is mandatory : relevant updates are posted there all the time and it is how you stay current. Before posting in the general channel, check that a teammate has not already asked the same thing and that it is not already answered in

announcements. Most of the time the answer is already there. Attempters use the general project channel. Reviewers have a separate channel, General Reviewers , and should talk there rather than in the general channel.

IF YOU DISAGREE WITH A REVIEW

Do not post it in the channel, where claims get buried and lost. Instead, fill out the disputes form and a QM will look into your case. That way every claim is tracked and nothing slips through: open the disputes form .

This Project Has Two Task Types

CHECK WHICH TYPE YOU HAVE BEFORE YOU START

Two different kinds of task arrive under this project. They share most of their rules, but one of the three questions is not the same and the questions come in a different order , so answering the wrong question is a serious error. Identify the type before you evaluate anything.

TYPE 1 - PROMPT TASKS

The task gives a written user request , and two websites generated from it. The three questions, in order: Aesthetics · Functionality and instruction following · Overall

TYPE 2 - SCREENSHOT CLONE TASKS

The task gives a reference image of a page, and two websites built to reproduce it. The three questions, in order: Functionality · Reference fidelity · Overall

How to Tell Them Apart

What you see	Type
A written request describing an app or website to build	Type 1, prompt task
An image of a page that the websites were asked to reproduce	Type 2, clone task
The questions are Aesthetics , then Functionality, then Overall	Type 1, prompt task
The questions are Functionality , then Reference fidelity , then Overall	Type 2, clone task

The quickest check is whether the task shows a written request or a reference image. The two types also order their questions differently, and even the functionality question does not measure the same thing in both, so confirm the type before you judge anything.

What Both Types Share

- Two candidates, always called Website A and Website B.
- Six fields: three options and three written justifications, none ever left empty.
- The same four options on every question: A is better, B is better, Both are good, Both are bad.
- Every justification runs 40 to 160 words.
- The three questions are answered independently, and the overall answer does not have to match the other two.
- Chrome only, and both websites inspected in their own browser tab.
- The same rules for writing, naming, ties, broken candidates and review.

EACH TYPE HAS ITS OWN SECTION BELOW

The general rules in this guide apply to both types, but the three questions are written out separately for each one, because they do not mean the same thing. Read the section for the type you have in front of you, and do not carry the criteria from one type into the other.

What You Evaluate and What You Don't

IN SCOPE

The result as it is seen and used inside the page : what it shows, whether it works, and how well it answers what was asked.

OUT OF SCOPE

The source code and the effort behind either website. You compare outcomes, not implementations.

Mandatory Setup - Chrome and the New Tab

GETTING STARTED

Conditions that apply to both task types: Chrome only, both websites inspected in their own browser tab, and never opening anything outside the task.

Chrome Is Mandatory

GOOGLE CHROME ONLY

Every task must be done in Google Chrome . Firefox, Safari, Edge, Brave, Opera and any other browser are not allowed . Rendering and interactive behavior differ between browsers, so a website judged in another browser is not comparable with the rest of the team's work.

Always Open the Website in a New Tab

NEVER EVALUATE FROM THE EMBEDDED PREVIEW

Each candidate tab shows the website inside a small embedded frame. That frame is not where you evaluate. Use the Open the environment in a new tab button and inspect the website in the full browser tab it opens. The embedded frame is cramped, can cut off layout, and can behave differently from the real page.

WHERE THE BUTTON IS

It sits in the dark bar at the bottom of the candidate tab, to the right of the Capture button . It is the small round icon showing an arrow leaving a square. Hovering it shows the tooltip "Open the environment in a new tab" . Do this for Website A and for Website B, every task, without exception.

On clone tasks this matters even more. The cramped frame distorts layout and spacing, which makes any comparison against the reference image unreliable.

The Full Tab Is the Source of Truth

JUDGE WHAT THE FULL TAB SHOWS

Everything you report must come from the website as it renders in its own tab. If the embedded preview and the full tab disagree about anything, the full tab wins .

Never Open a Link That Takes You Outside the Task

EXTERNAL ADDRESSES ARE NEVER OPENED

Clicking or interacting with anything that would take you outside the task environment is prohibited . That includes external websites, images, files, APIs and any other outside address, whether it appears in the task or inside one of the candidates. If a task references an external page, for example the original site a design came from, do not open it . There is no way to know what sits behind an address outside the task, so it is never opened.

JUDGE THE TWO CANDIDATES, NOTHING YOU WENT OUT TO FETCH

Decide which website is better without ever opening that address , using what the task itself gives you and what you can see in the candidates. On a prompt task that means the written request, and on a clone task that means the reference image. Never go looking for an original page to compare against.

Internal navigation inside a candidate is different and should be used: anchors, tabs and menus that move you around within the same page are exactly what the functionality question asks you to test.

When Something in the Task Cannot Be Seen

EVALUATE WITH WHAT YOU HAVE

Sometimes a task refers to material that is not available to you, such as an image that does not load. That does not stop the task. Evaluate it with the information you do have, and keep

every statement in your justifications to something you actually verified. If you never saw a reference, do not claim that one website matches it more closely.

Task Type 1 - Prompt Tasks

TASK TYPES

Tasks where a written user request was turned into two websites. All three questions, in order: aesthetics, then functionality and instruction following, then overall.

What This Type Gives You

USER REQUEST

The original written instruction both websites were trying to satisfy. It can be short, ambiguous, or extremely detailed.

WEBSITE A

One output generated for that request, in its own tab.

WEBSITE B

A second, separate output for that same request, in its own tab.

Read the User Request Carefully

THE APP

What specific app or website was requested.

ITS PURPOSE

What the user wants to accomplish with it.

KEY FEATURES

The sections, features, and controls explicitly requested.

VISUAL DIRECTION

Any explicit style instruction: palette, fonts, layout style, image style, reference brands.

The requested style feeds the aesthetics question, while the requested sections, features and behavior feed the functionality question. Noting them separately as you read saves time later.

Question 1 - Aesthetics, Visual Quality Only

1Which website is better visually?

- Layout and composition: structure, alignment, visual hierarchy, balance.
- Typography: font choice, sizes, weights, readability, consistency.
- Color: palette coherence, contrast, and respect for any palette the request asked for.
- Polish: professional finish, consistency across sections, quality of images and icons.

- Spacing: margins, padding, density, cramped or empty areas.
- Visual artifacts: overlapping text, elements overflowing their container, cut-off content, misaligned blocks.

Ignore whether controls work. A beautiful page whose buttons do nothing can still win this question.

ON A PROMPT TASK, NICER CAN WIN

There is no image to match here, so the better looking page wins, judged against the style the request asked for when it asked for one. This is the opposite of a clone task, where resemblance beats beauty. Do not carry the habit from one type into the other.

Question 2 - Functionality and Instruction Following

2Which website works better and delivers more of what was asked?

THIS QUESTION COVERS TWO THINGS

On a prompt task this field is not only about whether things work . It also carries instruction following : whether everything the user request asked for is actually present. A website whose controls all work but which left out half the requested sections is failing this question.

- Instruction following: the sections, features, content and data the request named are actually there.
- It loads and renders without crashing, freezing or leaving blank areas.
- Links, buttons and controls work: they do something and they update the content, rather than just existing.
- Navigation works: menus, tabs and anchors take you where they should.
- Interactive behavior works: filters, forms, carousels, counters and anything else that is supposed to respond.
- Nothing is dead or broken: no blank sections, no crashes, no controls that lead nowhere.

WHEN THERE IS NOTHING INTERACTIVE TO TEST

Some requests produce static pages with no controls at all, such as a landing page or a poster-style layout. That does not make this question unanswerable. When there is little or no behavior to test, the question becomes almost entirely about instruction following : judge which website delivers more of what the request asked for, and say so plainly in your justification.

Existence is not functionality. A candidate can look complete and still be a shell with nothing wired up. Scroll the full page and click everything before judging.

Ignore visual polish here, unless broken rendering is severe enough to prevent the page from being used at all. In that case it counts as a functionality failure.

Question 3 - Overall

3Which website provides the better complete experience?

IT DOES NOT HAVE TO MATCH THE OTHER TWO

Judge the whole result after weighing both lenses together: which website a real user would rather land on for this request. Your overall choice does not need to match either independent choice, and there is no formula that derives it from them.

When the two lenses disagree, the overall answer is a judgement about the trade-off. Ask which shortcoming does more damage to the request: a plainer look, or missing content and dead controls. As a rough tendency, functionality and instruction following carry slightly more weight than looks when the two disagree, since a website that does not deliver what was asked fails at what the user came for, but this is a starting point rather than a rule, and a large visual gap against a small functional one can still decide the other way. Whatever you conclude, the overall justification must make that weighing visible.

A VALID OUTCOME

Aesthetics: A is better. Functionality: B is better. Overall: B is better, because the missing booking flow costs the user more than a plainer hero does.

ALSO VALID

Aesthetics: A is better. Functionality: B is better. Overall: Both are good, because each one is strong where the other is weak and neither experience clearly beats the other.

OVERALL IS NOT A COPY OF ANOTHER ANSWER

Do not pick the overall answer by defaulting to whichever website won functionality, or by repeating the aesthetics answer. And do not reuse one of the other justifications as your overall one. If the overall justification only talks about looks, or only about behavior, it is not answering this question.

Per-Task Workflow

STEP 1

Read the Request

STEP 2

Open Both in New Tabs

STEP 3

Inspect Both Fully

STEP 4

Aesthetics, Functionality, Overall

- Scroll fully top to bottom. Never judge from the first screen alone.
- Interact with every control: links, buttons, tabs, sliders, dropdowns, toggles, forms, navigation.
- Check that controls actually update the content, not just exist visually.
- Note visual observations and behavioral observations separately, since they feed different fields.
- Answer the three questions in the order the form presents them, which on a prompt task is aesthetics first, then functionality, then overall.

Task Type 2 - Screenshot Clone Tasks

TASK TYPES

Tasks where a reference image was turned into two websites. All three questions, in order: functionality, then reference fidelity, then overall.

What This Type Gives You

ONE IMAGE, TWO ATTEMPTS TO REPRODUCE IT

You are given a reference image of a web page, and two websites built to reproduce it. There is no written brief to interpret. The image is the specification, and your job is to decide which website reproduces it better, which one works better as a real page, and which one is the better result overall.

The candidates are live web pages, not pictures. The reference is a static image, but Website A and Website B are real, interactive pages. They have to be opened, scrolled and clicked, not just looked at.

Study the Reference Image First

The image is the specification, so read it the way you would read a brief. Before opening anything, note:

STRUCTURE

How many sections there are, in what order, and how the page is divided into columns and blocks.

CONTENT

The actual words, labels, numbers and menu items visible in the image.

STYLE

Palette, typography, button shapes, borders, glow and shadow treatments, icon style.

DETAILS

The small things that are easy to drop: badges, tags, progress bars, decorative frames, corner cuts.

Keep the reference open in its own tab while you inspect the candidates. Comparing from memory is where most fidelity mistakes come from.

Question 1 - Functionality

1Which website works better as a real page?

BEHAVIOR ONLY, NOTHING ABOUT THE IMAGE

On a clone task this question is about behavior and nothing else. There is no written brief to follow here, so instruction following does not enter: whether a website matches the reference belongs entirely to the fidelity question that comes next.

- It loads and renders without crashing, freezing or leaving blank areas.
- Links, buttons and controls work: they do something when clicked, rather than just existing.
- Navigation works: the menu items move you to the sections they name.
- Interactive behavior works: tabs, filters, forms, counters, animations and anything else that is supposed to respond.
- Nothing is dead or broken: no controls that lead nowhere, no sections that never load.

The reference is a still image, so it defines no behavior. Judge what a visitor could reasonably expect from the elements shown: a menu item should move the page, a button should respond. Do not invent requirements the design never implies, and do not treat a missing visual element as a functional failure.

Existence is not functionality. These are clone tasks, so a candidate can look complete and still be a shell with nothing wired up. Click everything before judging.

Ignore resemblance here, unless broken rendering is severe enough to prevent the page from being used at all. In that case it counts as a functionality failure.

Question 2 - Reference Fidelity, How Closely It Reproduces the Image

2Which website is closer to the reference image?

THE QUESTION IS RESEMBLANCE, NOT BEAUTY

You are not asking which page is nicer. You are asking which one reproduces the image more faithfully . A website that improves on the reference with a cleaner palette or better spacing is further from it, not closer, and loses this question to a plainer copy that matches.

What to Compare, Point by Point

LAYOUT AND STRUCTURE

Are the same blocks in the same places, in the same order, at roughly the same proportions? Is the column split the same? Are sections missing, added, or reordered?

TEXT AND CONTENT

Do the headings, labels, menu items, numbers and body copy match what the image shows? Invented content and missing content both count against fidelity.

COLOR

Background tone, accent colors, gradients, glow. A copy that shifts the palette or drops a gradient is less faithful even when the result looks good.

TYPOGRAPHY

Typeface character, weight, letter spacing, uppercase treatment, and the relative size of headings against body text.

SPACING AND SCALE

Padding inside cards, gaps between sections, and how large each element is relative to the others.

DISTINCTIVE DETAILS

The features that give the design its character: cut corners, thin frames, badges, tags, progress bars, terminal panels, icon style. These are the first things a weak clone drops.

Worked Example

HOW A FIDELITY COMPARISON READS

Take a reference showing a dark arcade-style portfolio: a header with a diamond logo, a hero with a large pink and cyan glowing title, two angled buttons, three tag pills, a stats panel on the right with four labelled progress bars, and a terminal panel below. Website A keeps the angled buttons and the cut-corner frames, but renders the title in flat pink and cyan halves without the glow. Website B reproduces the glow and the gradient bars closely, but squares off the button corners and drops the thin decorative frame around the hero. Neither is simply better looking. The call comes from counting what each one preserved and what each one lost, and saying so.

Weigh differences by how much they change the impression. A missing hero treatment or a reordered layout matters far more than a border being two pixels thicker. Say which differences you considered significant and why.

Ignore whether controls work here. A perfect visual copy whose buttons do nothing can still win this question.

Question 3 - Overall

3Which website is the better clone overall?

IT DOES NOT HAVE TO MATCH THE OTHER TWO

Judge the whole result after weighing both lenses together: which one is the better delivery of the job that was asked, which was to turn that image into a working page. Your overall choice does not need to match either independent choice, and there is no formula that derives it from them.

When the two lenses disagree, the overall answer is a judgement about the trade-off. Ask which shortcoming does more damage: a copy that drifts from the design, or a copy that matches it but does nothing when used. As a rough tendency, a page that does not work fails at more than a page that looks slightly different, but this is a starting point rather than a rule, and a clone that barely resembles the reference can still lose despite working well. Whatever you conclude, the overall justification must make that weighing visible.

A VALID OUTCOME

Functionality: B is better. Fidelity: A is better. Overall: B is better, because the dead navigation in Website A costs more than the softer glow in Website B.

ALSO VALID

Functionality: B is better. Fidelity: A is better. Overall: Both are good, because each one is strong where the other is weak and neither result clearly beats the other.

OVERALL IS NOT A COPY OF ANOTHER ANSWER

Do not pick the overall answer by defaulting to whichever website won functionality, or by repeating the fidelity answer. And do not reuse one of the other justifications as your overall one. If the overall justification only talks about resemblance, or only about behavior, it is not answering this question.

Per-Task Workflow

STEP 1

Study the Reference

STEP 2

Open Both in New Tabs

STEP 3

Inspect and Compare

STEP 4

Functionality, Fidelity, Overall

- Scroll fully top to bottom. The reference image usually shows only part of the page, and everything below it still counts.
- Compare section by section against the reference rather than judging the first screen as a whole.
- Interact with every control: links, buttons, tabs, sliders, dropdowns, toggles, forms, navigation.
- Check that controls actually update the content, not just exist visually.
- Note fidelity observations and behavioral observations separately, since they feed different fields.
- Answer the three questions in the order the form presents them, which on a clone task is functionality first, then reference fidelity, then overall.

Choosing Your Answer

THE RUBRIC

The four options, applied independently to each of the three questions, on both task types.

The Decision Order

Every question has the same four options: A is better, B is better, Both are good, Both are bad. For each one, first decide whether one website is better on that question's criteria. Only if they are effectively tied do you pick a "Both" option.

A is Better / B is Better

Use this whenever one website beats the other on that question, regardless of whether either is good in absolute terms.

- On aesthetics, which only prompt tasks have: if one is visually cleaner or more consistent, it wins.
- On reference fidelity, which only clone tasks have: if one preserves more of the reference and loses less of it, it wins.
- On functionality: if more of its controls actually work, or if it is less broken, it wins. On a prompt task, delivering more of what the request asked for also counts here.
- On overall: if one is the better delivery of the whole job, it wins.

"BETTER" IS RELATIVE, NOT ABSOLUTE

Choosing "A is better" does not claim that Website A is good. It only says it beats Website B on that question, and this holds whether both are strong or both are weak. If one is only slightly less bad, it still takes the win. Whatever side you pick, the justification must clearly demonstrate the difference you are claiming.

Both are Good / Both are Bad (Ties Only)

Use one of these only for a genuine tie on that specific question, where no winner can be chosen at all. If you can make a case for either side, it is not a tie. When it truly is one, judge where the pair lands on a 1 to 6 quality scale:

1	2	3
Poor	Weak	Below Par

4	5	6
Solid	Good	Strong

BOTH ARE GOOD

Tied on that question, and both would land around 4, 5 or 6 .

BOTH ARE BAD

Tied on that question, and both would land around 1, 2 or 3 .

Decision Summary

Situation (per question)

One website is clearly better on that question

Option

A is better / B is better

Tied, both land in the 4 to 6 range

Both are good

Tied, both land in the 1 to 3 range

Both are bad

KEY RULE

"Both are good" and "Both are bad" are for ties, not for absolute quality on their own . If there is a real difference on that question, always pick the better side, even between two weak websites.

Handling Broken Candidates

THE RUBRIC

What to do when a website does not load or cannot be inspected. Breakage never blocks the task, on either type.

Breakage Is a Functionality Failure

SCORE IT, DO NOT SKIP IT

A website that fails to load, freezes the browser tab, or cannot be rendered enough to inspect is treated as a functionality failure . You still complete the task and all six fields. You do not skip the task and you do not need to report it anywhere: describe the breakage in your justifications and move on .

Before You Call It Broken

- Confirm you are in Chrome.
- Open it with the new tab button rather than judging the preview.
- Scroll the whole page, since content can sit below the fold.
- You may refresh and try again.

How It Affects Each Question

AESTHETICS OR FIDELITY

A page that renders nothing offers nothing to look at and reproduces nothing, so the working website wins. Say plainly that there was nothing to assess.

FUNCTIONALITY

The working website wins. Describe what happened: blank tab, frozen page, or content that never loaded.

OVERALL

The working website wins. A page that cannot be used is not a delivery anyone can prefer.

If both websites are broken, select Both are bad on all three questions and state in each justification that neither website renders, or name the error each one shows. Do not invent differences between them, and the word minimum does not apply in this case.

Writing the Justifications

THE RUBRIC

Length, stating the outcome, keeping each one inside its own lens, naming the candidates, and what each must cover. These rules apply to both task types.

Where the Value Lives

The written fields are where most of the value of this task lives. Write one per question and keep the three of them independent. A reader should be able to take any one of them on its own and understand why that option was chosen.

The platform labels these fields differently depending on the task type, as reason or as rationale. They are the same thing and the same rules apply to both.

Length

LENGTH

Minimum 40, maximum 160 words for each one. The range applies to each field on its own, not to the three combined.

STRUCTURE

Open with the outcome, then give the concrete evidence, describing both websites rather than only the winner.

State the Outcome Explicitly

SAY WHO WINS, DO NOT ONLY DESCRIBE

Each justification must open by stating the outcome of its own question, and that opening must match the option selected. Listing good and bad points without naming a result is not enough.

WHEN ONE WINS

Open with "Website A is better because..." or "Website B is better because..."

WHEN IT IS A TIE

Open by naming the tie, for example "Website A and Website B are tied because..." , and make clear whether the pair is good or bad.

Keep Each Justification Inside Its Own Lens

PROHIBITED: MIXING THE TWO LENSES

It is forbidden to mention behavior in the aesthetics or fidelity justification, and equally forbidden to mention looks or resemblance in the functionality justification. Each of those two must talk only about its own field, and one that crosses over is incorrect even if everything it says is true. The overall justification is the one place where both may appear together, because weighing them is exactly what that question asks for.

ALLOWED IN THE AESTHETICS OR FIDELITY JUSTIFICATION

Layout and composition, alignment, hierarchy, spacing and scale, typography, readability, palette, gradients and glow, image and icon quality, overall polish, overlapping or cut-off elements. On a clone task, also anything present in the reference that is missing or added.

ALLOWED IN THE FUNCTIONALITY JUSTIFICATION

Whether the page loads, whether links, buttons, tabs, forms, filters and navigation respond and update the content, and anything dead or broken. On a prompt task only, also which requested sections, features and content are present or missing, since instruction following belongs to this field there. On a clone task it does not.

 **BAD** (aesthetics justification talking about behavior) "Website A is better because it looks cleaner and its filter buttons update the listings, while Website B has a search bar that does nothing."

GOOD ON A PROMPT TASK

Aesthetics: "Website A is better because it keeps a consistent palette and even spacing between sections, while Website B mixes several bright tones and crowds the hero text against the image." Functionality: "Website B is better because its search filters update the listings and every requested section is present, while Website A is missing the booking form and its category tabs never change the panel below." Overall: "Website B is better because the cleaner look of Website A does not make up for its missing booking form, and a traveller landing on Website B can actually search and reserve."

GOOD ON A CLONE TASK

Fidelity: "Website A is better because it keeps the angled buttons, the cut-corner frames and the four labelled progress bars from the reference, while Website B squares off the buttons, drops the thin frame around the hero and renders the title without the glow the image shows." Functionality: "Website B is better because its menu items move the page to the sections they name and its buttons respond when clicked, while nothing in Website A reacts to a click and its navigation leads nowhere." Overall: "Website B is better because the closer visual match of Website A does not make up for a page where nothing can be used, and a visitor landing on Website B can actually move through the content."

On a Clone Task, Anchor the Fidelity Justification to the Reference

IT IS A THREE-WAY COMPARISON

On a clone task the fidelity justification compares three things, not two. Say what the reference shows, then what each website did with it. Naming specific elements that were preserved, altered or dropped is what makes the judgement verifiable.

✗ BAD (a fidelity justification that never mentions the reference)"Website A is better because it looks cleaner and better organised than Website B."

Writing the Overall Justification

SHOW THE TRADE-OFF, DO NOT REPEAT YOURSELF

The overall justification must explain how you weighed the two lenses against each other. When the two other answers disagree, say which shortcoming mattered more and why. When they agree, say what makes the combined result clearly better rather than restating one of them.

✗ BAD (a copy of the functionality justification)"Website B is better because its navigation works and Website A does nothing when clicked."

Rules for Each Justification

- State the outcome first, matching the option selected in that question.
- Stay inside the lens. No behavior in the aesthetics or fidelity justification, no looks or resemblance in the functionality one. Only the overall justification may hold both.
- Name them correctly. When you name a candidate, write it as Website A or Website B. Never shorten it to just the letter and never invent another label such as Site A, Page B, Option A, the first one, or the left one. Collective wording is fine, so "both websites" and "neither website" are perfectly acceptable, and so are ordinary pronouns once a website has already been named in the sentence or the one before it, for example "Website A keeps a consistent palette, and it spaces its sections evenly". The rule exists to stop bare letters and invented labels, not to force the full name into every clause.
- Be specific and concrete. Name the actual difference a reader could go and verify.
- Describe both websites, not only the winner.
- Report problems. Mention breakage or non-working controls in the functionality justification, and visual artifacts or dropped design elements in the aesthetics or fidelity one.
- Do not name the evaluation categories. Describe what each website shows or does in plain language instead.
- Keep a tie balanced. A tie must not read as one-sided, for example by listing more faults for one website than the other.
- Do not reuse text across the three fields.
- Stay in scope. Write in the third person and describe only the task material and the two websites. Do not mention the browser, the tabs, or the platform.

Quick Task Checklist

GETTING STARTED

The per-task checklist used to confirm a task is complete before submitting.

Setup Checklist

- ☐ Task type identified: prompt task or clone task.
- ☐ Working in Google Chrome.
- ☐ No external address opened, whether it came from the task or from inside a candidate.
- ☐ On a prompt task: user request read carefully, with the requested style noted separately from the requested features.
- ☐ On a clone task: reference image studied and kept open while comparing.
- ☐ Website A opened in its own tab with the new tab button.
- ☐ Website B opened in its own tab with the new tab button.

Per-Website Checklist (repeat for A and B)

- ☐ Scrolled the full page, top to bottom.
- ☐ On a clone task: compared section by section against the reference image.
- ☐ Interacted with every control and checked that it updates the content.
- ☐ Breakage noted: blank, crashed, overlapping, or overflowing areas, and where.
- ☐ On a prompt task: checked which requested sections, features and content are present.
- ☐ Visual observations noted separately from behavioral observations.

Decision Checklist

- ☐ The non-functionality question answered was the one the task actually asks: aesthetics on a prompt task, reference fidelity on a clone task.
- ☐ Each question answered on its own, not copied from another out of habit.
- ☐ Real difference checked first in each question. "Both" options used only for genuine ties.
- ☐ All three options selected and all three justifications written.
- ☐ Every justification between 40 and 160 words.
- ☐ The aesthetics or fidelity justification mentions nothing about whether controls work.
- ☐ On a clone task: the fidelity justification is anchored to the reference image.
- ☐ Functionality justification mentions only behavior, plus requested content on a prompt task.

- ☐ Overall justification explains the trade-off rather than repeating one of the other two.
- ☐ Each justification opens by stating its outcome, matching the option selected.
- ☐ Candidates named as Website A and Website B, with no bare letters and no invented labels.
- ☐ All six fields completed, none left empty.

Common Mistakes to Avoid

The Most Frequent Errors

ANSWERING THE WRONG NON-FUNCTIONALITY QUESTION

Judging beauty on a clone task, or judging resemblance on a prompt task. On a clone task a candidate that improves on the reference has moved away from it and loses that question. On a prompt task there is no image to match, so the better looking result wins. Check which type you are on before you decide, and remember that the two types also order their questions differently.

TIE OPTIONS CONTRADICTED BY THE JUSTIFICATION

Picking "Both are good" or "Both are bad" and then writing a justification that names a winner. If your text says one website is closer, more complete or less broken, it is not a tie.

ANSWERING ALL THREE THE SAME WAY BY DEFAULT

Picking one winner and repeating it three times without judging each question on its own criteria. It is a valid outcome when it is earned, and a serious error when it is inertia.

Setup and Review Mistakes

- Evaluating from the embedded preview instead of opening each website in its own tab.
- Using a browser other than Chrome.
- Opening an external address referenced by the task or by a candidate.
- On a clone task, comparing against the reference from memory instead of keeping it open.
- Judging from the first screen only, when the page continues well below it.
- Confusing existence with functionality. A control that is visible but does nothing is not working.

Decision Mistakes

- Letting a working control decide the aesthetics or fidelity question, or a visual impression decide the functionality question.

- Treating the functionality question the same way in both types. On a prompt task it also covers instruction following, and on a clone task it covers behavior only.
- Treating the overall answer as a formula derived from the other two, or copying whichever one felt strongest.
- Using a "Both" option when one website is actually better on that question.
- Choosing a "Both" option based on absolute quality alone instead of first checking for a real difference.
- Weighing a tiny difference, such as a slightly thicker border, the same as a missing section.
- Rewarding the number of features over actual fulfillment of what was asked.

Justification Mistakes

- Mixing the lenses: naming controls or breakage in the aesthetics or fidelity justification, or colors and layout in the functionality one.
- On a clone task, writing a fidelity justification that never mentions the reference, and only compares the two candidates against each other.
- Reusing the same text in more than one field, especially recycling one justification as the overall one.
- Writing an overall justification that never weighs the trade-off, and only repeats one lens.
- Never stating the result, so the reader has to infer the verdict from the evidence.
- Leaving a justification vague instead of naming the concrete difference.
- Naming a candidate with a bare letter or an invented label, such as "A", "Site A" or "the first one", instead of Website A and Website B.
- Writing a justification shorter than 40 words or longer than 160 words.
- Making a tie sound one-sided.
- Leaving any field empty. All six are required.

Quick self-review before submit: would a teammate reading only your three justifications understand which website won each question, why, and what concrete evidence supports it, without any of them drifting into another one's territory?
